List Scheduling

實驗內容:

■ 撰寫List Scheduling的C/C++程式

程式碼:

程式說明:

Input 方式:

兩組 Data Flow Graph 分別以.txt 的方式做資料建構,分別為 p1.txt 及 p2.txt。

Output 方式:

產生一個 Scheduling outcome.txt,裡面紀錄了每次運算的結果。

使用說明:

- 1. 選擇要載入哪一組 Data Flow Graph。欲選擇 p1 則輸入 p1.txt,選擇 p2 則輸入 p2.txt。
- 2. 輸入 resource constraint 乘法器跟加法器數目。
- 3. 程式會將排程結果顯示在銀幕上,同時也會寫入 Scheduling_outcome.txt。
- 4. 如果需要其他數目的 resource constraint 則輸入 1 繼續,輸入 2 結束。

實驗結果及分析:

```
***********
       Resource Constraint
*
       Mult Constraint:2
       Add Constraint:2
************
                v 10 = v
State: 1
               v 11 = v 6 + v
State: 1
State: 2
               v 12 = v 10 + v
State: 2
               v 13 = v 11 + v
State: 3
               v 15 = v 13 + v
State: 3
               v 14 = v 12
                           + v
               v 16 = v 14
State: 4
                           +
State: 5
               v 18 = v 16
                           *
                                16
State: 5
               v 17 = v 16
                           * v 16
               v 19 = v 17 + v 12
State: 6
               v 23 = v 18
                           + v 15
State: 6
State: 7
               v 22 = v 19 + v 16
State: 7
               v 20 = v 12
                           + v 19
               v 25 = v 23
                           + v 15
State: 8
State: 8
               v 24 = v 22 + v 23
               v 21 = v 20 * v 20
State: 8
State: 9
               v 26 = v 10 + v 21
State: 9
               v 27 = v 25
                           *
                              v 25
State: 10
               v 29 = v 26 + v 19
State: 10
               v 28 = v 10
                               26
                           +
                             V
               v 30 = v 28 * v
v 32 = v 27 + v
                           * v 28
State: 11
State: 11
                                 5
               v 31 = v 29 + v
State: 11
               v 33 = v 31 * v 31
State: 12
               v 35 = v 32 + v
State: 12
                           + v 32
State: 12
               v 34 = v 23
State: 13
               v 38 = v 35 *
                              v 35
State: 13
               v 37 = v 11
                           + v
State: 13
               v 36 = v
                         1
                           + v
State: 14
               v 41 = v 37
                           *
State: 14
               v 40 = v 33 + v
                                - 5
                v 39 = v 36 + v 26
State: 14
State: 15
                v 42 = v 31 + v 40
State: 15
                v 43 = v 32 + v 38
```

每個 state 皆無資料相依,且運算元一定在被計算出來後才使用。
